```

Everything seems to be working fine, the application is displayed as the code is run without issues.

There are seven different screens in the application, each displaying different informations of the database.

2) Functional Analysis

1)

There are seven main features :

- The main screens present the current exhibition and future workshop as well as their themes, prices and locations.
- The artists section with the main artists information as well as a search bar and filters to help finding specific artists.
- The artworks screen with the artworks listed with their prices and artists.
- The gallery section with the different galleries and their locations.
- The exhibition section displaying the location, theme and date of the different exhibitions.
- The workshop information page with all the information on the different workshops offered.
- The community page with contact information on the artists community.

2)

There are two different user profiles that can be implemented, first is the admin that can add, delete and modify data in the database including user profiles, the second profile is the user that can simply see the application display without being able to modify the data.

3)

Use case diagram :

In blue : what is already implemented in the application
 in red : the features that are not implemented yet

As you can see the only features already implemented are the users one whereas the admin ones are not there yet.

3.Static Design
